Subject: ATTN: UIC Discussion Draft, re: quality of concrete and cement used in well sleeves.
Date: Friday, January 22, 2016 8:44:44 AM

To whom it may concern:

Please instigate a high standard for the quality of cement and concrete used in well sleeves for all drilling, especially in frack wells, underground storage facilities, and underground waste disposal wells.

According to Anthony Ingraffea of Cornell University, all fracking wells will leak sooner or later. If the cement or concrete sleeves are made of too-watery cement the leaks will be sooner and they will be worse.

It is important that the specifications be made VERY SPECIFIC on what quality of cement and concrete be used in those sleeves, that each well be inspected and regulated and that officials in companies that flout those regulations be jailed, as well as their companies fined with the possibility of not being able to do business in the State of California any more.
